

Somatosensory rehabilitation method

Wake up your skin to put to sleep your pain

It is three o'clock in the morning and you can't stop walking in circles in the kitchen because you can't sleep. A part of your body is burning or more precisely it is like it is burning, because when you touch it, its temperature is absolutely normal.

Moreover, some electric shocks appear to a point that you have difficulty to breath. Gradually, you don't recognize yourself anymore, you are irritable, on edge, everything bothers you. You suffer from neuropathic pain, a painful affection of the nerves, those electric wires that connect the "eyes" of your skin to your brain.
